Stainless Steel “LaserScreens” for Tofu Applications

“LaserScreens” are laser drilled stainless steel screens which have perforations made to suit customer’s requirements.

LaserScreen perforations may be circular or slot-shaped, and taper outwards through the thickness of the screen. Such tapered apertures help prevent blinding of the screen, which can be a problem with straight sided apertures.

For Tofu applications most screens have circular hole apertures of diameter 0.1 – 0.15 mm in stainless steel thicknesses of 0.45 – 0.9 mm. Open Areas range from 5 – 9 %. These specifications can be varied to suit individual requirements.

LaserScreens are being increasingly used in the large tofu factories of Asia.

Screens are available in:

- Rectangular shape, which can be formed into cylinders.
- Drilled to shape, for use in machines requiring conical shaped screens. Drilling to shape reduces wastage and cost, compared to screens that are supplied only as rectangular sheets.
